

5.9 Workshop

A Park with a Walkway

The aim of this workshop is to use as many of the Sandbox tools as possible to create a garden with a walkway and other typical things that you'd find in a park (using components).

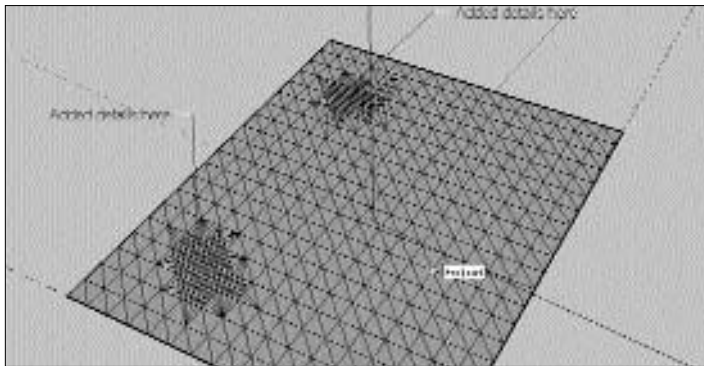

To create the park with the path, do the following:

- Activate the Sandbox from Scratch tool.
- Create a sandbox—a grid of length 100' and breadth 80'. You can do this by specifying the exact lengths in the VCB.

Making Ground

- Use the context click menu to explode the surface.
- It's now time to make a few hillocks in the garden, so we'll activate the Add Detail Tool. This will result in the surface dividing into a triangulated terrain.

Detailing some parts help to Smoove better

- Use the Select Tool to select two or more sections of the park you'd like to make into little hills. Click the Add Detail Tool
