

Heralding the endpoint

2.3.1 Point Inferences

While you draw the inference engine detects at which point the pencil (mouse cursor) has been situated and instantly gives you a ToolTip telling you exactly which point it is, with reference to other points and aspects of your model. For example, if you hover the cursor on the corner of one of the polygons you created earlier, the inference engine will inform you that you're on an endpoint.

The different kind of inferences, their colours and what they indicate are listed in the table below for your quick reference:

Point Inference	Colour	What it indicates
1 Endpoint	Green	The end of a Line entity or Arc entity
2 Midpoint	Cyan	The middle point of a line or 'edge'
3 Intersection	Black	The exact point where a line intersects another line or face
4 On Face	Blue	The point lies on a "Face Entity" (basically, the point you have chosen lies on the side of a 3D model or shape you have already drawn or set up)
5 On Edge	Red	The point lies on a line or "edge"
6 Equi-Distant on Edge	Magenta	A chamfer (an equidistant point between two connected edges)
