

Motherboard And Graphic Card

Q My first problem—I have a Lenovo Y500 notebook with face recognition feature. Most of the latest games requiring NVIDIA graphic cards are not supported by it. Is it possible to change its configuration? If not, then here is my second question. I have a 4-year-old Compaq Presario PC, and its motherboard doesn't have the required slots for a graphic card. Please tell me a suitable motherboard and graphic card that can play games like *Matrix*, *Lord of the Rings*, *Half-Life* and other latest games. My budget for now is Rs 8,000. Please help me, so that I can return to my world of gaming again.

A GeForce 7600GT AGP card will be a cheap yet a fairly powerful upgrade

Akash Sharma

A Laptops allow upgrading certain components like memory and hard drives. A graphics solution is not possible on your laptop. If you wish to play lots of games, then a complete overhaul is required. If your Compaq Presario has an AGP slot, then you could look for an AGP GeForce 7600GT. A motherboard change today would mean you have to go for a new processor and DDR2 667 memory as well, and then a new graphics card would be unavoidable.

Problem Playing High Resolution Videos

Q My computer has Intel Original 845GVS motherboard, Pentium 4 2.4 GHz Processor, 256 MB RAM, 80 GB HDD. I don't have an AGP slot. I'm using Windows XP 32-bit. Recently, I formatted my system due to some viruses and made a new copy of XP. The problem is that when I try to play XVID or AVI, having resolution above 1000x650 (below 1000x650 resolution works well), the system suddenly crashes showing a black screen. I'm unable to operate anything. The system still runs in the background. I have updated all my motherboard drivers, and also installed some codecs. These haven't

Trying using third party applications like Media Player Classic and VLC Player for HD playback
