

Urgent

Q I am your regular reader and a longtime subscriber of Digit. Lately, I came to my hometown (UP) on vacation. Since the Internet connection at home is BSNL 750UL+, which runs at 256 Kbps, I tried using my own company's account (Punjab), which is a Business 15000 account that runs at 8 Mbps. I entered the username and password for my company's account, but it shows authentication failure.

Please note that Business 15000 is multi-user account, which I can connect easily in Punjab and it runs over multiple systems. I tried different settings in Router (Siemens SL141_121), but it just didn't work.

I hope you guys will surely help me out of this. The slow speed is killing me. It's my first technical help related e-mail to you.

Sayed

A It could be possible that the multiple connections are only allowed from within a state or district. You should call up the ISP and ask for more clarity on this.

Actual Speeds

Q I am using a Tata Indicom broadband connection, which has 3 months validity at 256 Kbps at a cost of Rs 3,203. (About Rs 1,100 per month with no download limits at 256 Kbps). The actual download speed is about 30 Kbps (As shown by download managers). It takes nearly 1 hour for a 100 MB file to download. Is this the normal speed? Then what does 256 Kbps mean?

Aanand

A Basically, the speeds you should be getting are $256 \text{ Kilo bits per second (Kbps)} / 8 = 32 \text{ Kilo Bytes per second (KBps)}$. And you're getting 30 KBps, which is quite normal.
