

Connectivity Problems

Q Although my Compaq C754TU is connected to the Internet via a USB modem (Tata Indicom's Plug2surf), I cannot view any Web page in my browser(s), an error message is displayed "Server cannot be found. Check your connection and then try again". And even if a few Web sites open up, they take ages to load. I know this isn't a broadband, but it isn't a dialup connection either. Is it due to a problem on the server? Cannot be, as people from customer care came and checked it, and found nothing was wrong with the signal. Is it due to wrong settings, but then how do I get connected. Nothing is wrong with the USB modem either.

GP P

All Network Connection Status boxes will tell you how many packets are being sent and received. If a lot of data exchange is happening, and you're not really using the network, beware of viruses!

A Check your computer for any viruses or worms. Look at the speed at which the connection is uploading and downloading. Go to a different location and see if your connection speed improves. Also, try visiting some Indian sites and see if you do get better speeds.

LAN issue

Q I have an HP Pavilion Laptop (Model No dv1624tn). Everything works fine except LAN. Earlier it was working fine, but now from past few days, whenever I insert the LAN cable, it says limited connectivity. Else, it gets connected. However, I couldn't surf the Net and it doesn't open any Web page.
