

Cute Problems

Q I use Windows XP SP2 on my system. I had installed Creator Pro version 2.0 (build# 31). I tried to make a setup with it. At 99.99 per cent, the setup creation process stopped and it displayed an error message. Can you please help me? When I tried to install Windows XP SP3 on my friend's PC, it stops by displaying a message as shown in the attached picture. Can you please solve the problem? Also, in the March 2005 edition, you have given a

Windows XP Service Pack 3 refusing to install unless all modifications are removed

way to integrate SP2 into Windows XP. Now can you please show me a way to integrate Windows Vista SP1 to Windows Vista? Thanks

Chikku George Thomas

A Most likely, the error is because the installer ends up being too big. If you are using FAT32 partitions, then you are bound to get this error. Use a NTFS partition and try again.

The reason your friend is unable to install Windows XP SP3 is because he has some kind of enhancement utilities installed for the login screen or for boot up screens. Uninstalling these applications and restoring the default Windows files will allow you to install SP3.

vLite like nLite, allows customisations to the Vista installation

Vista integration can be done using software called vLite (www.vlite.net), which is very much like nLite.
