

that it's not detected on boot up, thus giving sound from the on board card? I can't disable it from BIOS, as I need both of them as 1 in XP 2 in Linux.

ranjan2001

A 1. To determine the name of the sound cards, type `'cat /proc/asound/modules'`. (In my case, the output will be `'snd_emul0k1' & 'snd_intel8x0'`.)

2. Open the file `'/etc/modprobe.d/alsa-base'`.

3. At the end of this file, add

```
options snd_emul0k1 index=0
```

```
options snd_intel8x0 index=1
```

Here `'snd_emul0k1'` and `'snd_intel8x0'` are my two cards (Creative and onboard, respectively). After doing this, the card which is given index = 0 (`snd_emul0k1` in my case), will become the default.

I think this will solve your problem. Even if the Creative card is not giving 4.1 sound, you can still use it instead of the onboard card, in Ubuntu.

unni

Right-click volume control in the Taskbar, open Volume Control > Edit > Preferences. Now select surround and wave surround from the list. Finally, adjust the front and rear speakers. This should give you 4.1 sound.

Q I have latest version of Firefox 3 through Ubuntu updates, but it has been crashing for me.

gary4gar

A Have you got flashgot installed? Disable automatic download manager detection.

Mehulved

Thanks! That solved my problem. Disabled "automatic download manager detection" in flashgot settings.
