

Can't Edit wvdial.conf

Q I can't edit wvdial.conf in Ubuntu, it says permission denied. Please help me

Gigacore

A Open terminal and type:
`sudo nautilus`

In the window that opens now, navigate to the file and happy editing

iMav

hddtemp Problem (FC 8)

Q Fedora noob here.

I had installed gnome-applet sensors and hddtemp. I have added hardware sensors monitor to the panel. Now under the sensors applet preferences tab, I find only libsensors. It should display libsensors and hddtemp. How can I invoke this hddtemp?

Previously I was on Ubuntu, I remember that after installing hddtemp, a wizard came forth, and allowed me to configure it (like startup at boot). On Fedora, nothing of that sorts happened.

I hope my query is clear enough. Please help me.

cool_techie_tvm

A Make sure you have installed smartmontools and make sure your HDD is smart capable and enabled. Install hardware-monitor or computertemp, if sensors applet is not working

Need Help

Q I have installed Fedora core, I already have Windows XP on my C: drive. Now whenever I start my system, it gives me a screen where I have to hit a key to reach another screen, where I can select which OS I want to boot. Is it possible that instead of the first screen, I get the second screen where I can choose the OS? I want to boot and the first screen gives me only 2 seconds.

vicky_I7

A Yes, just try to boot into Fedora before grub MENU appears. The solution is:

Press [Alt] + [F2] to get a run dialog. Now insert the following command to open grub.conf
