

10. In the Properties Inspector, choose the option Sync in order to match the Timeline and the animation of graphic symbol instances.

We can also create Motion Tween along a Path. This process is discussed next.

5.2.2 Creating The Motion Tween Along A Path

Just imagine you have visited an unknown tourist spot. You don't know which path you will follow so that you can reach the destination. What will you do? A voyage of discovery? Jokes apart... you should take a guide. A guide knows the route. He will take you to your destination. Similarly in Flash a motion, a guide defines the trajectory of the movement of an object. If you apply Motion Guides a new Layer is introduced which is called a Motion Guide Layer. Whatever you draw as a guide in the Motion Guide Layer is not visible in the final animation.

The Motion Guide layers are basically used by objects to acquire a logical position. Lines and shapes can be drawn into the Guide layers. These lines and shapes are used by the objects to justify the position.

Now let's see how Motion Guide is used:

1. Say you have an object placed in the first key frame
2. Convert it to a graphic
3. Set the registration point at the centre
4. Now create another keyframe where you tend to complete the animation
5. Now if you apply motion Tween then you will get a linear movement, so don't do that at this point of time
6. Add a Motion Guide Layer
7. Now with your pencil Tool draw a path which should be fol-

Guide Layer
