

Data type	Default value
Boolean	false
int	0
Number	NaN
Object	null
String	Null
Uint	0
Not declared	Undefined
All other classes	null

2.3 Creating Objects

Objects are the most important components in Flash ActionScripting. They are basically complex values containing additional values or variables known as properties. An object can be created by using the new operator. The following code creates a new object instance.

```
// Creating a new object instance

var myValue:Object = new Object();
person1 = new Object();
```

The above code creates two object instances, called myValue and person1.

Adding Properties

Properties can be added to the object instances with the help of the .operator as shown below:

```
person1.firstName = "Frodo"; // here a property,
firstname is added to the object instance person1.
```

Accessing Properties

For accessing the properties of an object, the programmer can do this using the dot operator or the same can be achieved by using
