

```
var i:int = 5;
do
{
    trace(i);
    i++;
} while (i < 5);
// output: 5
```

3.3 Boolean Logic

Boolean logic is an important concept that is used widely in Flash ActionScripting. There are many examples of applications that require multiple factors in branching logic. The two most important and common Boolean operators that are used in ActionScripting are the Logical OR and the Logical And operator.

Logical And Operator (&&)

The syntax that is usually followed while writing logical And operator is as follows:

Usage `expression1 && expression2`

The above expression returns `expression1` if it is declared false or converted to false and `expression2` otherwise. The various values that can be converted to false include 0, NaN, null, and undefined. A function call used as `expression2` does not call the function if `expression1` is evaluated to false.

It is to be noted however that if both operands are of the type Boolean, the result becomes true only if both operands are true. This can be shown by the following table.

Expression	Evaluates
<code>true && true</code>	true
<code>true && false</code>	false
<code>false && false</code>	false
<code>false && true</code>	false
