

the variable name of the text box

- Now click on the Text Tool again, and create another text box

Creating a Text Box

- Set the text type as Dynamic Text, font as _sans and assign 'b' as the variable name of the text box.

Setting the text box to dynamic text

- Now in Layer 1, right click in the first keyframe and click on the 'Actions' to open the Action Script window.

Creating another Text Box

- Here type this code:

```
var user:Login2 =
new Login2("John");
var a
userNameStr:String
user.userName;
a=userNameStr
user.userName =
"Della";
b=user.userName
```

Properties Window

Here, a new object, called 'Login 2' is created with the help of the new operator and the name 'John' is passed as parameter. The get method is then called. Next another variable named userNameStr is declared which is of String type. Next the set method is called. The string 'Della' is stored in the variable username which is further stored in the variable 'b'.
