

`return, short, signed, sizeof, static, static_cast, struct, switch, template, this, throw, true, try, typedef, typeid, typename, union, unsigned, using, virtual, void, volatile, wchar_t, while.`

In addition, the following words are alternative representatives for some other operators, and hence cannot be used.

`and, and_eq, bitand, bitor, compl, not, not_eq, or, or_eq, xor, xor_eq.`

3.3 Data Types

There are various data types in the C++ programming language. These are used to hold different types of values. Here are the various types of data and the description of the data type:

Name	Description
<code>Char</code>	Declares characters or small integers. ASCII characters can be used with this type of data.
<code>short int (short)</code>	Declares short integers.
<code>int</code>	Declares integers and whole numbers in a program. These numbers may be positive or negative.
<code>long int (long)</code>	Declares longer numbers.
<code>bool</code>	Declares the Boolean value. Value can be either 'true' or 'false'.
<code>float</code>	Declares floating point decimal numbers.
<code>double</code>	Declares double precision floating point numbers.
<code>long double</code>	Declares long double precision floating point numbers.
