

```
#define NEW '\n'

int main ()
{
    double r=5.0;           // This variable
is created for radius
    double circle;

    circle = 2 * NI * r;
    cout << circle;
    cout << NEW;

    return 0;
}
```

The output of this program will be as follows:

11.1234

In the above example, ‘#define’ is not a C++ directive. Rather, it is a directive for the pre-processor. Therefore, there is no need to insert a semi colon at the end of it, as it presumes the entire line as a directive.

Besides, C++ has built in constants that we can directly use in our code. These constants have fixed names, so that we can recognize these constants. The minimum value of the short integer is named as SHRT_MIN and the maximum value of the short integer is named as SHRT_MAX. Consider, the following example:

```
#include <iostream.h>
#include <limits.h>
int main()
{
    cout << "The minimum signed character: " <<
SCHAR_MIN << "\n";
    cout << "The maximum signed character: " <<
SCHAR_MAX << "\n";
}
```
