

```
        cout << "The value that is to be insert-  
ed is: ";  
        cin >> i;  
        cout << "You have inserted this value "  
<< i;  
        cout << " and the double value is " <<  
i*2 << ".\n";  
        return 0;  
    }
```

The output of this program is as follows:

```
The value that is to be inserted is: 702  
You have inserted this value 702 and the double  
value is 1404.
```

In the above program an integer variable 'i' is created. Next, a message is displayed on the screen. Next the program accepts the input from the user and the value is assigned to the variable 'i'. The fourth line displays a string as well as the value of 'i'. The last line prints a string and the value of 'i' after adding '2' with it.
