

nated with a semicolon after the closing curly brace `{}`). Objects can also be created within the `main()` function. The syntax is as follows:

```
Class_name object_name;
```

Here, `class` refers to the class whose object is to be created. `object_name` represents the name of the object.

6.1. Specifying A Class

.....

A declared class has two types of specifications:

1. Class declaration
2. Definition of class function

Consider the following class example:

```
class QRect
{
    int m,n;
public:
    void setter(int, int);
    int area(void); } rect;
```

Here, a class `QRect` is declared with two private variables `m` and `n`. Next, two methods are declared - `setter` and `area`. The variables declared are data members, while methods are known as member functions. `rect` is the object of class `QRect`.

Consider the following programs.

Program 1

```
#include <iostream.h>
class Calculation {
    int x, y;
```
