

6.3 A C++ Program With Class

In this section, let us consider a program where the above concepts are implemented.

```
#include<iostream.h>
class i1
{
    int number;
    float cost;

public:
    void get_value(int x, float y);
    void put_value (void)
{
    cout<< "number :" <<number<<"\n";
    cout <<"cost:" << cost <<"\n";
}
};

void i1 :: get_value (int x, float y)
{
    number = x;
    cost = y; }

int main()
{
    i1 i2;
    cout <<"\n object i2 "<<"\n";

    i2.get_value(378,78.6);
    i2.put_value();

    i1 i3;
    cout <<"\n object i3 "<<"\n";

    i3.get_value(37,8.6);
```
