

```
<?php
include("notexist.php");
echo "Why are you doing this!";
?>
</body>
</html>
```

Error message:

```
Warning: main(notexist.php) [function.main]:
failed to open stream: No such file or directory
inc:\wamp\www\php_check_bs\adv6.php on line 4
```

```
Warning: main() [function.include]: Failed open-
ing 'notexist.php' for inclusion
(include_path='.;C:\php5\pear') in
c:\wamp\www\php_check_bs\adv6.php on line 4
```

Why are you doing this!

Let us use the above example with the require() function:

Example:

```
<html>
<body>
<?php
require("notexist.php");
echo "Why are you doing this!";
?>
</body>
</html>
```

Error Message:

```
Warning: main(notexist.php) [function.main]:
failed to open stream: No such file or directory in
c:\wamp\www\php_check_bs\adv6.php on line 4
```

```
Fatal error: main() [function.require]: Failed
opening required 'notexist.php'
(include_path='.;C:\php5\pear') in
c:\wamp\www\php_check_bs\adv6.php on line 4
```

The echo statement has not been executed here as the script execution has been stopped after the fatal error. It is advised to use the require() function in place of include() because the scripts cannot be repeatedly executed if the files are missed or miscalled.
