

```
echo "Can't send ";
}
else
{
$mail = $_REQUEST['mail'] ;
$sub = $_REQUEST['sub'] ;
$msg= $_REQUEST['msg'] ;
mail("myfriend@ourmail.co.in", "Subject: $sub",
$msg, "From: $mail" );
echo "mail is ready";
}
}
else
{
echo "<form method='post' action='ourmail.php'>
Email: <input name='mail' type='text' /><br />
Subject: <input name='sub' type='text' /><br />
Message:<br />
<textarea name='msg' rows='10' cols='50'>
</textarea><br />
<input type='submit' />
</form>";
}
?>
</body>
</html>
```

The PHP filters have been used to validate input in the above example:

- All illegal e-mail characters from a string are removed by the `FILTER_SANITIZE_EMAIL`.
- The `FILTER_VALIDATE_EMAIL` filter validates value as an e-mail address.

10.5. Error

In PHP, default error handling is very simple. It returns an error message with line number, filename and a message indicating that the error is sent to the browser. Error handling plays an important role when creating scripts and web applications. A program with no error checking code appears very unprofessional.
