

Comparison operators

The 'Comparison Operators' verify the relationship between a variable and its value. These operators are usually inserted within a conditional statement and it returns boolean values like true and false. Look at the various types of Comparison Operators:

Comparison Operators	Name	Function
<code>==</code>	Equal	This operator is used to check if the two variables hold equal values.
<code>===</code>	Identical	This operator is used to check whether two variables hold equal values and the data type of them are also the same.
<code>!=</code>	Not Equal	This operator is used to check if the two variables hold unequal values.
<code>!==</code>	Not Identical	This operator is used to check for unequal values and for the different data types.
<code><</code>	Less than	This operator is used to check if the value of one variable is lesser than that of another.
<code>></code>	Greater than	This operator is used to check if the value of one variable is greater than that of another.
<code><=</code>	Less than or Equal to	This operator is used to check if the value of one variable is less than or equal to the value of another variable.
<code>>=</code>	Greater than or Equal to	This operator is used to check if the value of one variable is greater than or equal to the value of another variable.
