

String operators

There are two types of 'String Operators': the Concatenating Operator ('.') and the Concatenating Assignment Operator ('.='). The Concatenating Operator joins the right and the left string into a single string. The Concatenating Assignment Operators add the argument that is placed on the right side of the equal operator with the argument placed on the left side of the 'equal' operator.

Example:

```
$first_string = "Welcome";  
$second_string = " Jack";  
$third_string = $first_string . $second_string;  
echo $third_string . "!";
```

The output of the above program is as follows:

```
Welcome Jack!
```

Combined operators

As the name suggests, the Combined Operators are the combinations of different types of operators.

Look at the various types of Combined Operators:

Operator	Name	Example
+=	Plus & Equals	\$a += 4;
-=	Minus & Equals	\$a -= 6;
*=	Multiply & Equals	\$a *= 4;
/=	Divide & Equals	\$a /= 3;
%=	Modulus & Equals	\$a %= 6;
.=	Concatenation & Equals	\$example_str.="Welcome";
