

```
?>
```

The output of this program is as follows:

```
Array ( [0] => red [1] => brown [2] => yellow )
```

Here, multiple values are simultaneously assigned to an array. It is also possible to assign values to an array one by one using keys as shown below:

Example 2:

```
$numerals = array( );
$numerals[]="3";
$numerals[]="9";
$numerals[]="11";
$numerals[]="7";
Associative array:
```

Associative arrays are indexed with strings in lieu of numbers. Look at the example below:

Example:

```
<?php
$marks["Ram"] = 80;
$marks["Raj"] = 60;
$marks["Rahul"] = 50;
$marks["Rajam"] = 0;

echo "Ram Obtained- " . $marks["Ram"] . "<br />";
echo "Raj Obtained- " . $marks["Raj"] . "<br />";
echo "Rahul Obtained- " . $marks["Rahul"] . "<br />";
echo "Rajam Obtained- " . $marks["Rajam"];
?>
```

The output of this program is as follows:

```
Ram Obtained- 80
Raj Obtained- 60
Rahul Obtained- 50
Rajam Obtained- 0
```

asort() - This function is used to sort an associative array on values.
