

```
$hello="Are you Jack's brother?";  
echo addslashes($hello);  
?>
```

The output of the above program is:

```
Are you Jack\'s brother?
```

### bin2hex()

The `bin2hex()` function converts a string of ASCII characters to hexadecimal values. This was introduced in PHP3.

### chop()

The `chop()` function is the pseudonym of `rtrim()`. This function was introduced in PHP3. Look at the example:

Example:

```
<?php  
$text = "\t\t We are using chop :) ... ";  
$choped = chop($text);  
echo $choped."<br>";  
$choped = chop($text," \t.");  
echo $choped."<br>";  
?>
```

The output of the above program is as follows:

```
We are using chop :) ...
```

```
We are using chop :)
```

### chr()

The `chr()` function returns a single character string from an ASCII value that is already specified. This function was introduced in PHP3. Look at the example below:

Example:

```
<?php  
$string .= chr(27); /* include an escape character  
at the end of $string */  
/* This will often help */  
$string = sprintf("The defined string will end in  
escape: %c", 27);  
?>
```

### chunk\_split()

The `chunk_split()` function divides a string into a sequence of
