

small fragments. This function was introduced in PHP3.

Example:

```
<?php
// formatting $info by using the RFC 2045 semantics
$new_strng = chunk_split(base64_encode($info));
?>
```

convert_cyr_string()

The `convert_cyr_string()` function is used to convert a string from one Cyrillic character-set to another set. It was introduced in PHP3. Look at the types that are supported by this function:

```
"k - koi8-r
"w - windows-1251
"i - iso8859-5
"a - x-cp866
"d - x-cp866
"m - x-mac-cyrillic
```

str_ireplace()

The `str_ireplace()` function is used to replace some case insensitive characters in a string. This function was introduced in PHP5. Look at the example below:

Example:

```
<?php
$bdtag = str_ireplace("%bd%", "blue", "<body
text=%BD%>");
?>
```

str_repeat()

The `str_repeat()` function is used to repeat a string, a specified number of times. This function was introduced in PHP4. Look at the example below:

Example:

```
<?php
echo str_repeat("*-", 8);
?>
```

The output of the above program is as follows:

```
*-*-*-*-*-*-*-
```
