

6.5 Implementing inheritance

Inheritance is a concept by which members (property and method) of one class can be used by another class.

Example:

```
<?php
class pclass
{
    var $p_val;
    function p_getval()
    {
        $this->p_val = "parent";
    }
    function p_showval()
    {
        echo "We are in $this->p_val class method";
    }
}
class cclass extends pclass
{
    var $c_val;
    function c_getval()
    {
        $this->c_val = "child";
    }
    function c_showval()
    {
        echo "We are in $this->c_val class method";
    }
}
$cobj = new cclass();
$cobj->p_getval();
$cobj->p_showval();
$cobj->c_getval();
echo "<br>";
$cobj->c_showval();
?>
```

The output of the above program is as follows:

```
We are in parent class method
We are in child class method
```
