

The next step is selecting the keyboard layout, which is USA-USA for the standard QWERTY keyboard. Advanced options are available include mapping individual keys, so it is possible to take out all the keys on the keyboard, put them back in different locations, and remap the keyboard. Just because you can do it, you don't have to.

Step 4 is creating a partition table for installation. Don't worry at this step, if you have chosen to install Linux on your hard drive, you probably have backed up all the data that is important. If not, then install Linux by using Virtual Box, and skip this method. By default, Linux makes space for itself from the space available. This is done by resizing an existing partition.
