

tition, and one swap partition should be sufficient.

The next step is a simple prompt asking if you are sure that you want to continue with the operations. If you are sure that you want to go ahead with the partitioning, click on OK, and go right ahead. The Linux partitioner (usually a program called gparted) will start working now. Halting the operation in the middle will have disastrous consequences on your hard disk. The extent of the disaster will be that a section of the hard disk will mysteriously disappear from your OS. Your files still won't be affected, but it is a good idea to do this operation when you are sure of a steady supply of electricity.
