

connecting from your laptop, while maintaining a windows desktop as the main computer, you will need to change the machine id your laptop. This is because many service providers lock their connection to a single machine id. To determine the machine id of your Windows machine, go to run or cmd and type

```
ipconfig /all
```

In the list of figures, look for a line that says physical address, which should look like:

Physical Address. : 00-34-8B-0Z-42-09

Now start up the connection editor in Linux, and enter this id in the MAC field.
