

install the software. For example, this software requires you to enter `$ python install.py --dir /usr install`, in the

A screenshot of a terminal window titled 'Terminal'. It displays a list of files being unpacked, organized by version and source directory. The files include various source code files (.cpp, .h) and build files (.in) for Inkscape versions 0.96 and 0.46, covering extensions like cairo, gimpgrad, ps, and bitmap, as well as internal components like Makefile, hitmap, and levelchannel.

```
inkscape-0.96/src/extension/internal/wpg-input.cpp
inkscape-0.46/src/extension/internal/pdt-cairo.h
inkscape-0.96/src/extension/internal/gimpgrad.cpp
inkscape-0.46/src/extension/internal/gimpgrad.h
inkscape-0.96/src/extension/internal/ps.h
inkscape-0.46/src/extension/internal/cairo-renderer.h
inkscape-0.96/src/extension/internal/bluredge.cpp
inkscape-0.46/src/extension/internal/cairo-png-out.cpp
inkscape-0.96/src/extension/internal/makefile.in
inkscape-0.46/src/extension/internal/cairo-png-out.h
inkscape-0.96/src/extension/internal/Makefile-insert
inkscape-0.46/src/extension/internal/hitmap/
inkscape-0.96/src/extension/internal/bitmap/sample.h
inkscape-0.46/src/extension/internal/hitmap/emboss.h
inkscape-0.96/src/extension/internal/bitmap/levelchannel.h
inkscape-0.46/src/extension/internal/hitmap/contrast.h
inkscape-0.96/src/extension/internal/bitmap/level.h
inkscape-0.46/src/extension/internal/hitmap/at1Paint.cpp
inkscape-0.96/src/extension/internal/bitmap/blur.h
inkscape-0.46/src/extension/internal/hitmap/reduceNoise.h
inkscape-0.96/src/extension/internal/bitmap/wave.cpp
inkscape-0.46/src/extension/internal/hitmap/contrast.cpp
```

command line. There may be other options available depending on the software you are installing. While unpacking into a folder, the terminal may show rows of what appear to be random text like

This is the list of files being unpacked. Be patient while this happens.

The next step is to configure the installation. This can be done by going to the folder of the unpacked files in the terminal and typing `$ ./configure`

The terminal will check the files against the system and throw a long list of checks like:

```
checking build system type... i686-pc-linux-gnu
checking host system type... i686-pc-linux-gnu
checking for a BSD-compatible install...
/usr/bin/install -c checking whether build environ-
ment is sane... yes checking for a thread-safe mkdir
-p... /bin/mkdir -p checking for gawk... no
and so on...
```

You need not worry about all of this. Just scan the text for errors. In this installation of Inkscape, a vector graphics editor, there is one error.
