

The P&S exposed

Typically, digital P&S cameras have a separate viewfinder and lens, so the subject you see is as your viewfinder sees it and not as the lens (which is usually a couple of inches lower down) does. This may cause a discrepancy in what you thought you shot and the actual picture, especially with close-ups – and this is called the “parallax effect”. Some compact

digital cameras have an electronic viewfinder system (EVF) that electronically simulates the effect of the optical TTL viewfinders found on digital SLRs and doesn't suffer from parallax errors. However,

The view you find isn't the view of the camera

The traditional SLR worked in much the same way, except for the film
