

To expose or not to expose...

f-number and Sharpness

Typically, you would like to stick to the middle range of f-stops and the sharpest image is usually obtained in the range of about $f/5.6$ to $f/8$. High f-numbers sometimes spoil the shot due to diffraction (the softening of the image which makes it lose its sharpness), vignetting (dimming/darkening on the edges of the picture) or aberration (degraded sharpness, lowered contrast, distorted shape).

f-number and Depth of Field

The greater the f-number, the greater the depth of field. So you'll need a higher f-number for landscapes and lower one to
