

batteries are not easily available, and if you run out of charge, the only option is to recharge it. However, proprietary batteries take longer to drain than AA batteries. Although AA batteries are cheap, they have to be purchased often.

Taking care of the batteries, and managing them properly is vital to the longevity of the equipment, and the amount of photos you can take at one charge.

Batteries drain out when they are in the camera, even if you're not using the camera. If your camera is kept in a shelf without being used, it's a good idea to store the battery separately. Low quality AA batteries may leak and ruin the equipment, or make it require a cleanup. Proprietary batteries will lose charge over time, and when you take the camera out, you may realise that you have a drained battery. It makes sense to carry around a set of spares.

If you're using AA batteries, make sure that you use the same brands with the same amount of charge. Rechargeable batteries are a common solution for cameras that use AA batteries. While rechargeable batteries make sense economically, they also get drained quicker than AA batteries. Charging takes a long time too, so you might require two sets of rechargeable batteries. In this case, do not mix and match the sets, and replace an entire set every time you change batteries.

To increase the life of proprietary batteries, charge the battery to the fullest (don't overcharge), then drain it completely and repeat the cycle. Purchasing an extra, or even two extra batteries at the time of purchasing the camera makes good sense. This means that you will have a battery to spare if the battery drains out, and you will not need to hunt for a battery later on. You might have to go out of your way to a specialist or enthusiast shop for obtaining a replacement proprietary battery.
