More flexible navigation

So how do we go about doing this? All we need to do is to create a dropdown box listing the no. of items to display per page and refresh the page every time this value is changed. Simple!

The reason it is that simple is because all our functions have been written taking into account the variable 'itemsPerPage'. Now it is merely a matter of changing the value of 'itemsPerPage' and then refreshing the contents of the page and the functionality is ready!

First we add a select box to our HTML page.

```
<p>
```

```
    No. of items to display per page:
```

```
    <select id="itemsPerPage" onchange="changeItemsPerPage()">
```

```
    </select>
```

```
</p>
```

This is added above the data list.

Now we create a function to generate options for this select box. You can of course have all of this statically present in the HTML file, as this will not change once the page loads. However, it will be much more controllable via JavaScript.

```
function generatePageOptions(from, to, step){
```

```
    ippSelect = document.getElementById('itemsPerPage');
```

```
    for (i = from; i <= to; i += step) {
        var newElem = document.
```
