

window that can be tweaked. You can reduce the file size by selecting lower quality, or selecting a specific file size. You can change the colour scale, or get rid of the EXIF data. For GIF to PNG or TIFF conversion, you can preserve transparencies or discard them. After suitable options are checked, click on OK.

Once you are done, simply apply the style to all images

For access to the advanced options, check Use Advanced Options (for bulk resize) and click on Advanced. Although the menu says these advanced options are for bulk resize, they can be used for other purposes as well. There are two basic approaches to resize the photograph, which are cropping the photograph and resizing the photograph. For cropping the photograph, you can specify the relative x and y start and end positions for the crop operation. You can crop and resize a photograph simultaneously. The Resize menu has a number of options, you can specify a width or a height and automatically adjust the rest of the image in proportion, or specify both the dimensions of the image. The size can be measured in pixels, centimetres, inches or percentage values as per your convenience.

This menu also allows you to rotate the image, perform basic adjustments such as flipping the image or auto colour correct the image. The Add Overlay Text option can be used to include simple watermarks to the all the images in a folder, for uploading on third party sites. Some filtering options are also available, including blur, sharpen, brightness, contrast and gamma correction. If you have selected all the operations you want to perform, its a good idea to save the settings now. This will allow you to simply load the settings in case you want to perform the same operations on another folder of images. Settings are saved in an INI file that can be edited
