

a library. This library can be saved, so that you don't have to repeat the search again the next time you start up. This search takes some time, after which all the icons will show up in icon editor. Select any one of the icons that show up, and click on Edit icon. This will edit the icon directly in its location, and save it. This is useful for changing the system icons, or default icons of your software to customise the way your software icons look, or to apply a particular theme to non-system software as well.
