

move it along either the X or Z axes to make the second leg of the table. You can use the Ctrl + C and Ctrl + V shortcut keys for doing this. Next, select both the “legs” of the table, copy paste them, and move them along X or Z axes to make the other two legs of the table. Now select all the objects together, a small menu will appear, select G. This groups the objects together, and you can manipulate them as a whole. This means that resizing and moving operations will treat all the four table legs as one object. At this point, you should have something like this.

Making the legs of the table

Rendering a test image

Create another cube for the surface of the table. This should appear all around one of the table legs. Resize this cube to make it flat, and stretch it till it covers all the four legs. Then, select the table legs, as well as the surface, and use the align tool to align

Applying textures

the surface. First, use the Y top alignment, this will align the top surface of the legs with the surface. Then use the X and Z centre aligns, and the surface should be perfectly aligned with the legs. Increase the height of the surface just a little
