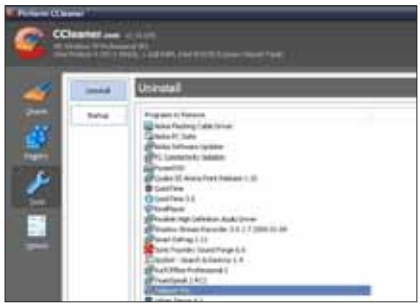
saved into your 'My Documents' folder.

6.1.3 Tools

Under tools, you have the CCleaner Uninstaller. This lists all the applications currently installed on the system. You will be surprised to see several applications that you don't even remember are there on your system. These are perfect candidates for removal from the system. Select these and click the "Run Uninstaller" button to remove them from your system.



CCcleaner Uninstaller

Options

The options button deals with the preferences of CCleaner. You have five sub options namely Settings, Cookies, Include, Exclude and Advanced.

Settings deals with usability options such as choosing to run CCleaner at startup, updates, etc.

The Cookies tab lets you decide the cookies you want to keep and those you wish to delete. Simply move these cookies to the "cookies to keep list"

Include lets you force delete some files and folders that CCleaner would not have ordinarily touched. Here you might want to add folders where you regularly dump data. When you click Add Folder, you can also specify the file type such as `*.bmp` or leave it to `*.*` to get rid of everything.

Exclude performs the opposite function.

The Advanced tab has some other settings such as minimise to system tray. We recommend that you run CCleaner every month. It will help in keeping your systems from becoming too congested. Remember, less than 20 per cent free space degrades system performance.
