

What are the required skills?

Makkar feels that to grow in this industry one needs to build on problem-solving skills. He says, “One should know how to get one’s job done. How should I aim at this problem to solve it? How to convey the idea in the best possible manner to the person I am working with? And yes constant learning never hurts as this is a new field.”

He sees the industry becoming more specialised by the day — as demand for specific kinds of virtualisations increase, hence the need for domain experts. “Domain experts have such great value in the US market. That is going to happen here as well. If one keeps moving from one field to another, one can never attain specialisation. Even within the organisation, you move in a vertical. The good thing is young people today show an aptitude that might help them in moving in that direction. Freshers these days aren’t naïve. They like applied research and want industry oriented research. They are focused.”

And for those keen on starting their own firm, Kakkar is definitely hopeful. “There are of course the big guns like NetApp, EMC, VMWare and Microsoft – but even today there is space for small start-ups to fill the gaps. There are smaller firms that offer adapters for virtualisation. But expanding would be a problem as infrastructure troubles would always bother them.

Compensation

Entry Level	6-8 lakh
10-20 years	25-50 lakh

Sample of a job description

We are currently looking for an architect (SAN or NAS Virtualization) to be based at Bangalore with the following skills:

- Individual will have a Masters Degree in technology with 12 - 18 years of IT development experience, with incursions into architect typical roles.
