Face-2-Face with Employer

“Compensation grows with time and responsibilities. Years of experience is given less weightage than the output/skills of a person.”

Ajay Pandey
CEO of Mastiff

What are the required skill sets?

All mobile application courses have a pre requisite that students need a strong knowledge of software languages (C, C++, Java) and knowledge of mobile phone software application. In most job openings, it does not specify the requirement of a specific mobile application course.

According to Bothra, the most important skill is to “learn how to learn”. This industry is really about breaking the barriers of the mind and thinking innovatively. It is all about having the passion to spend ten hours with your mobile phone without talking or sending an SMS on it.

Further, Siddhartha Singh who is a Senior Technical Manager at Mavenir Systems, believes: “The key success factor in this career is to accept change. You cannot restrict yourself to only one technology. For instance, there are certain platform where only Java works whereas on a Windows platform it is mostly .NET. Similarly, in Symbian there are many other choices. So one must be open to accept that technologies change at a very fast pace”.

Ajay Pandey, the CEO of Mastiff advises anyone in this space to constantly keep tabs on what is happening on the global front. From there aim to match your idea or creation with the global standards. Keeping updated on new technologies is essential to staying ahead. Work hard and finish one product cycle, do not leave in between.

What is the required mind set?

The industry changes so rapidly that you have to be open in your thinking and adaptable to change every minute. Thinking beyond what you see today and believe in creating a difference. You have to feel challenged enough and desire to be different. The key to this career is to not have a mind set.
