

Sample job description

Position Title: Security specialist
Department: Engineering

Position Summary:

The candidate will be responsible for driving the adoption and evolution of security engineering best practices within local product development teams. This includes driving threat modelling activities, conducting technical security assessments at an architecture, design and implementation level, and providing technical security guidance and training to engineering staff.

The ideal candidate would be an experienced developer or security consultant with a solid knowledge of current security engineering practices and a detailed understanding of design and implementation level security vulnerabilities and mitigations. Hands-on experience developing or implementing a secure development lifecycle process, and conducting application level security testing, is also desirable.

Candidates with limited security experience, but with a strong software engineering background and a desire to move into a more specialised security engineering role will also be considered.

Primary Responsibilities:

- Security analysis of product architecture, design, and implementation
- Driving the adoption and evolution of security engineering best practices
- Identification and analysis of potential security vulnerabilities
- Identifying and driving longer term product and process improvements
- Making technical and business recommendations to product teams
- Providing technical guidance and security training to development teams
- Technical risk assessment
- Writing and reviewing product security bulletins

Required:

- Detailed knowledge of current secure development best practices
- Experience deriving threat models or attack trees
- Detailed knowledge of common software vulnerabilities
- Ability to identify and implement longer term product and process improvements
- Ability to derive and apply creative attack techniques
- Ability to analyse potential vulnerabilities to determine if an exploit is feasible
- Ability to analyse the risk presented by potential vulnerabilities
- Ability to clearly and effectively communicate with engineers and management
- Bachelors degree in computer science or related field

Desirable:

- CISSP/CSSLP/GIAC certification
- Detailed, low-level, technical knowledge of Windows, Unix, or Linux operating systems
- Hands-on software development experience
- Solid understanding of C/C++ development on Windows or Unix platforms
- Good understanding of Java or .NET and related tools and technologies
