

Gnome, Theme and Desktop

The Gnome section allows login, theme, and font customisation. The Login section allows customisation of Gnome through themes as well as options such as XDMCP, sounds, and root login. To customise the GDM theme, either select one of the default themes or click the “...” button next to the theme selection box and choose a custom theme. The custom theme can be a tar.gz or tar.bz2 package. Reconstructor will extract and install the theme into the live CD environment. You can

Customising the boot interface menu

then select the custom theme from the selection box. The same applies for the “Theme” section to select and import custom window themes and icons. The “Desktop” section allows for font and wallpaper customisation.

Apt

This section is only relevant if you plan to add software to your live CD. Some software needs Repositories added to Ubuntu before it can be installed. Reconstructor is a good example

– do you remember that when we were installing Reconstructor, we needed to go into Synaptic Package Manager and make sure

Hint

For information on creating a usplash theme, see the <https://help.ubuntu.com/community/USplashCustomizationHowto>
