

simultaneously, with Bluetooth being the bridge that links them all.

- The Bluetooth SIG is also promoting UWB, or ultra wideband, which will allow faster access and higher data transmission rates.
- The Bluetooth Low Energy Technology has great potential in micro-sensors.

So using Bluetooth, there's connectivity, communication, entertainment, health, commerce, plus a great deal of untapped potential in several other sectors. Of course, there's always competition: from different wireless technologies to companies such as Logitech creating their own technologies that allow for an easier sync between their own products. It's Bluetooth's advantages that differentiate it from others – it's free and it does not consume much power. Wireless technologies are here to stay, and though Bluetooth may be a relatively late entrant, it has made its mark and should survive.
