

algorithms need to be robust and self configuring. The operating systems that are used also need to be streamlined because they are made for a specific purpose. As a result, the operating systems used in WSN systems are much less complex than the usual ones in PC systems. The system is similar embedded systems and thus it is also possible to use the OSs that have been developed for those purposes.

WSN was initially developed as a military tool and was used as a surveillance mechanism. Nowadays, however, there is widespread use of WSN in various areas such as health care, environment monitoring, global warming, area monitoring, wastewater monitoring, etc. There are also simulators that help in modelling and creating Wireless Service Networks.

7.5 Miscellaneous short range communication

There are many applications that the various short range point-to-point communication systems have been put to. These include many things that have revolutionised aspects of our lives. Some of these are:

- The National Database and Registration authority (NADRA) in Pakistan and also the Transport department of New Delhi have issued driver's licences that have RFID tags on them. There is a database that stores the information of all

RFID tags are being used by transport authorities to keep track of the offences committed by drivers

the licence holders. The database also contains a history of all past offences that a driver has carried out, which includes data regarding traffic violations, tickets issued, and outstanding penalties. The traffic police are supposed to carry identification machines that can

help gather information from the RFID tags in the licences. This helps greatly speed up the process of prosecution of driving offences. It is even possible to cancel the driving licence electronically in case the concerned person carries out some serious offence.

- Some theme parks around the world provide their customers with wristbands that contain an RFID tag. This helps the park to identify the various customers and where they are at any given point of time within the park. This
