

off Caps Lock.

[W]: to move the object in X,Y or Z axis

[E]: to rotate the object on any axis

[R]: to scale the selected objects

Screen Setup

This is fairly simple to understand. You can click on any of the buttons and then see how the layout changes. This allows you to adjust the display according to your wishes.

Animation Timeline

Just as with any other timeline, this shows you which frame you are on.

Range Slider

This is simply a slider used to isolate the frames on which an artist wishes to work.

Mel/Python script editor

This is where you input commands and execute your scripts. The icon on the extreme right of the same line is used to expand the editor and typing area, so that you can see more than a single line of script.

The Attribute Editor

This lists the attributes of the selected object and is a larger version of the Channel Box. The Channel Box shows you the compact version of the object's attributes, whereas the attribute editor gives you full control of each and every attribute of the object. Each tab on the attribute editor represents a set of information for the selected object. This is arguably the most important tool in Maya.

You can activate the Attribute editor by clicking on the red coloured area. You can also select the object and click [Ctrl] + [A] on both Windows and Mac to activate this. The section marked in Red is the Attribute editor. All the shortcuts for the Windows, Linux and Mac OS X version are the same.

This is fairly simple to understand. You can click on any of the buttons and then see how the layout changes. This allows you to adjust the display according to your wishes
