

Remember to keep saving your work. Now, Open your **Cube_House** scene and select one of the small cubes. Since it's a cube and not a sphere or a cylinder or even a flat planer, you can do Automatic Mapping on it. Click **Create UVs > Automatic Mapping**. This will put six small colourful and transparent projections around the object. You can change the number from

6 to 8 or 12 by clicking on the small square box beside your Automatic Mapping in **Create UVs > Automatic Mapping** (Small square option box). Once you map it, check the UV texture editor. You'll find that the mapping and sizes have changed and this is where you'll see the UVs laid out on a grid surface. To learn how you can stitch everything together and make it ready for texturing, watch the video titled **Uvmap_Box** on our DVD.

Note

The main aim to use this kind of texture is to check if your UV mapping is correct. You will notice that if any of the squares are stretched or squashed or don't look like squares any more, it only means that your mapping has gone wrong somewhere and you need to edit it again. If you have all squares with same width and height all over the model, then it's a very good UV mapping.

In the video, you'll learn how to:

- Split the window between UV Texture Editor and the Perspective Viewport.
- See the Shaded View by clicking on the blue box icon.
- After selecting the box, go to the Attribute Editor and click on the
- PolySurfaceShape1 tab and tick the Opposite checkbox. You can now see the difference in the viewport.

Save the file as **Uvmap_box** and press [Enter]. This saves in the scene folder where you had set your project in. Select any box; hold the right-click, which will show you a drop down menu as well. Go to **Assign New Material > Lambert** (We are only putting a texture on Out box to check that our UV Mapping happens accurately) and rename it to **Box_texture**. Click on the small black and white checker box next to colour and select File from the window.

Zoom into the box and you can see that the image is wrapped around it. Select the box again and go in the **Box_Texture** tab in the Attribute Editor and click on the small arrow beside colour which previously was a small checker. Once you go inside, you'll notice two tabs **File** and **Place2dTexture1**. Click on **Place2dTexture1**, locate **Repeat UV** and enter a value of 5 or 6 in the box and press [Enter]. You will now see that the squares on the boxes have gone smaller. The math is that the texture has only repeated itself five times, which is why it goes smaller.

In the UV Texture editor, expand the Viewport by hovering your mouse
