

10.2 Camera mapping

Both in the past as well as present there has often been queries of how to do camera mapping. The idea of this type of mapping is to take the texture from projection through a camera rather than local mapping.

This is often needed for VFX shots. Shots like the object seeming to come out of backgrounds and more often for effects like talking animals etc...

We are going to use much simpler objects to show this example.

Create a camera or use the persp camera and create an image plane
