

Ohloh (<http://ohloh.net>) is a web site which provides a web services suite and online community platform that aims to map the landscape of open source software development. By retrieving data from revision control repositories (such as CVS, SVN, or Git), Ohloh provides statistics about the longevity of projects, their licenses (including licence conflict information) and software metrics such as source lines of code and commit statistics.

The codebase history informs about the amount of activity for each project. Software stacks (list of software applications used by Ohloh's members) and tags are used to calculate the similarity between

Quick Tip

The most interesting part of OSUM is the OSUM Project Repositories (<http://tr.im/osumprojects>), which is a list of suggested projects in open source technologies which students can participate in. These projects are selected out of thousands of projects and are not very difficult to work on. It is a good place to look out for interesting topics to work on, if you are trying to identify your first open source project to contribute to.

OpenSolaris Projects listed at OSUM Project Repositories

projects. Contributor statistics are also available, measuring open source developers' experience as observable in code committed to revision control repositories. Social network features (kudos) have been introduced to allow users to rank open source contributors. A KudoRank for each user and open
