

Advanced Settings

Application Type: ☒ Web ☐ Desktop

Sandbox Mode: ☐ Enable ☒ Disable

Let's only the developers of your application see it.

Mobile Integration

SFHS Integration: ☐ Enable ☒ Disable

iPhone Application ID:

Let's you integrate your application with SMS.

If you have an iPhone app using Cocoa, fill this in with your Apple-provided application ID.

Set-up the application type to web

Basic

Authentication

Profile Tab

Tab Name:

Tab URL:

The url for your application tab on a profile.

Facebook only allows for you to have one URL, which must be identical to your website url.

Profile Box

Default Column: ☒ Video ☐ Photos

Where your profile box content appears. Users can toggle the location of the profile.

The profiles tab

is the just the fancy URL name that other people will be using to access your application page. Facebook will provide immediate feedback if that url is unavailable, in which case you should pick something else. The callback URL is the actual stuff that points to the application to your server. Make sure you enter the URL of the folder in which your index.php and other pages are located and not the actual index.php URL.

Digit Test App

Inventory Status: Not Submitted

(Inventory Report completed. Your application goes live. Submit the App Application Inventory.)
