

```

$commonFBML = "<div>This month's theme is xxxxx</div>";
$facebook->api_client->fbml_setRefHandle("temp",
$commonFBML);
$profileFBML = "
<div>
<h1>Theme</h1>
<fb:ref handle='temp' />
</div>";
$facebook->api_client->profile_setFBML(NULL, $appUserID,
$profileFBML,
NULL, NULL, NULL);

```

You can also do the same thing by using a URL and not setting the cache the FBML ahead of time. Instead, supply a callback URL from which the FBML can be retrieved. Call `fbml.refreshRefUrl()` and pass the URL to update it. The callback will return the FBML, and will only be called one time, not once per profile updated.

```

$profileFBML = "
<div>
<h1>This month's theme</h1>
<fb:ref url='http://thinkdigit.com/theme/'>
</div>";
$facebook->api_client->profile_setFBML(NULL, $appUserID,
$profileFBML,
NULL, NULL, NULL);
$facebook->api_client->fbml_refreshRefUrl("http://
thinkdigitserver.com/gettheme.php");

```

Modify the code for `$formBlock` in the `renderPage()` function in `profile.inc` to use `<fb:ref>` for the categories list and to update the list of available categories to all of our users at once:

```

$formBlock = "
<div class='sendFeedback'>
<span class='sendTitle'>Send FeedBack</span>
<form method='POST' id='FeedbackForm' action='".FB_APP_
URL."/>
<div class='categories'>
<fb:ref handle='profileCategories' />
</div>
<input type='hidden' name='target' value='$appUserID' />

```
