

a Feed story to his own Wall and Home page News feed. If these values were to be different, you should display the Other-Publisher, which allows publishing to the Wall of the user identified by `fb_sig_profile_user` and his/her friends' Home pages. If you want the Publisher to offer enhanced functionality to users that have authorised the application that provides it, you can check for the existence of `fb_sig_session_key` in the POST variables which is only sent when this is true.

Create a new file named `publisher_callback.php` in your application root directory. The core behaviors of both displaying a custom Publisher and publishing a story to Facebook are shown in the following code block which you need to add to `publisher_callback.php`.

```
<?php
require_once 'inc/globals.inc';
require_once 'inc/utils.inc';
require_once 'inc/db.inc';
require_once 'inc/profile.inc';
require_once 'inc/notifications.inc';
$fb = new Facebook(FB_API_KEY, FB_APP_SECRET);
$publisher = $fb->user || $fb->fb_params['page_id'];
$target = $fb->fb_params['profile_user']; //
$isSelfPub = $publisher === $target;
$publisherAction = $_POST['method'];
$fbResponse = '';
if( isset( $publisherAction ) &&
    isset( $publisher ) &&
    isset( $target ) ) {
    if( 'publisher_getInterface' === $publisherAction ) {
        $markup = getPublisherUI($isSelfPub ? $publisher :
$target);
        $fbResponse = array( 'content'=> array( 'fbml' =>
$markup, 'publishEnabled' => true ), 'method' =>
$publisherAction );
    } else if ( 'publisher_getFeedStory' === $publisherAction
) {
        $formValues = $_POST['app_params'];
        if( isset( $formValues ) ) {
            global $g_categories;
            if(!isset($fb->fb_params['page_id'])) {
```
